

CLOAKING GUIDE

BY DE PPO

WHITEHAT VISITORS
ENTER

Cloaking/Filtering is the process of protecting your money page, aka the page you want real visitors to see, from unwanted visits. We do that in order to protect our money generating funnel from people or entities with nefarious purposes.

In this guide, you'll learn all the basics on how to set up cloaking with some advanced settings even if you have never done this before. This is a newbie friendly guide but also offers specific advanced settings for a professional who is looking for a better filtering solution to test a new setup. At the end of this guide, you will be able to cloak and protect your money page from unwanted visits and be able to run traffic anywhere anytime you want.

Let's get started.

We will be using Zeustrak for this as it is both a tracker and a cloaker and offers you free 1000 visits a month to test and run on. You can also easily make several accounts on this platform if you need to run more traffic.

Head over to <https://zeustrack.io/> and make an account. You will be asked to enter your email and follow through with a simple registration process to create your team.

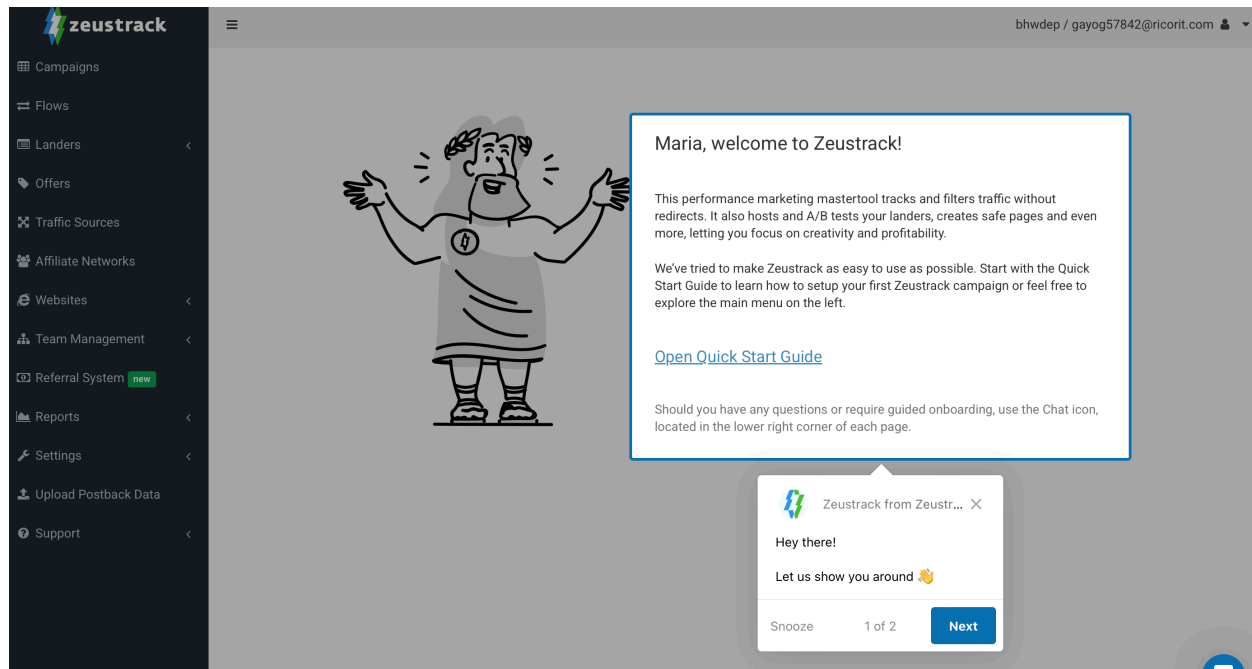

Registration

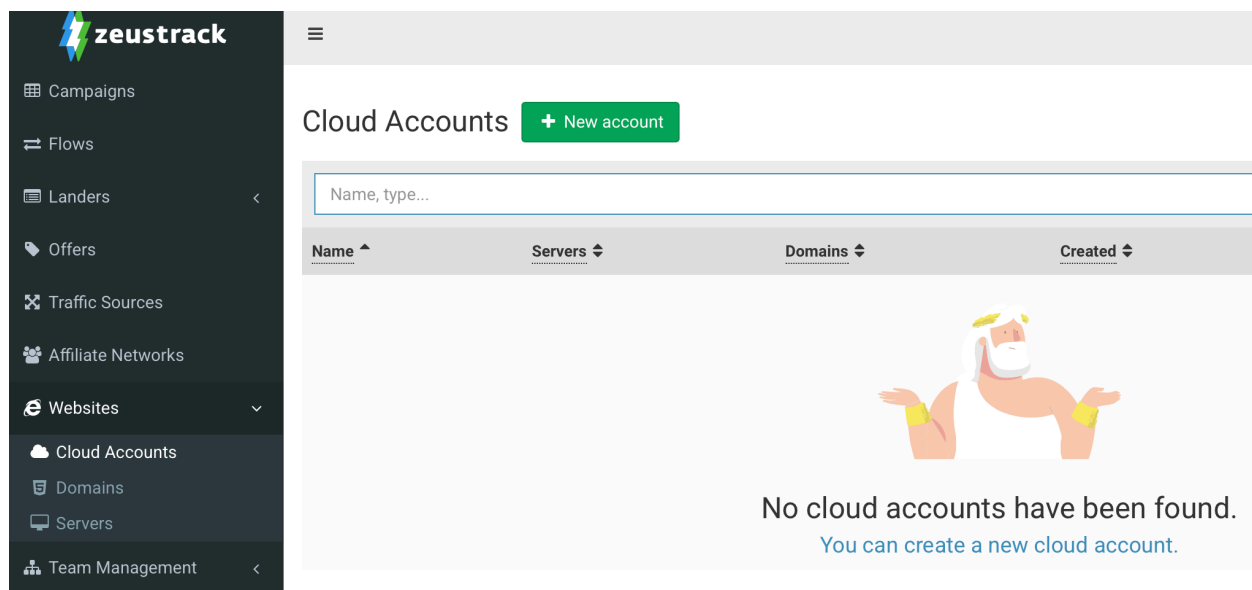

Get started

Already using Zeustrack? [Sign in!](#)

The welcome screen upon successfully logging in looks as follows:

On the left panel click “Websites” to expand the option where you are presented with 3 submenus, Cloud Accounts, Domains and Servers. Now click on Cloud Accounts and you should see the following screen:

- Campaigns
- Flows
- Landers
- Offers
- Traffic Sources
- Affiliate Networks
- Websites
- Cloud Accounts
- Domains
- Servers
- Team Management
- Referral System new
- Reports
- Settings
- Upload Postback Data
- Support

bhwdep / ge

New Cloud Account

To start working with the websites you should create Cloud Account first.

Select account type:

How it works:

To start using Zeustrak cloud landers or custom safe pages you'll have to integrate the [AWS](#) account and perform the initial setup.

Step 1: Log In to Your [AWS Account](#) or Create a New One

- Go to the <https://aws.amazon.com> webpage .
- In the top right corner press the **My Account** drop-down menu and choose the **AWS Management Console** option

Click to create a new cloud account where we will be creating servers on. Why do we need to do that? Because on those servers your campaigns will be running loading safe pages. What are safe pages? They are simple sites that are used to disguise your actual money pages from prying eyes and unwanted visitors. As you see above we have 2 options here, an AWS cloud or a Digital Ocean cloud account. You can get started on both of those for free. For the sake of the example we will be using an AWS account. Zeustrak offers you instructions as you see above on how to login/create an account on either one of these 2 cloud providers.

Follow those instructions and scroll at the end where you will see this:

Please type the characters as shown above

Call Me Now

8. If the phone verification was successful, you'll be prompted to choose a plan. If you are unsure of what plan to choose, just try the **Free** one.

Next step

* Account Name

ex: account@email.com, John Doe Account 1...

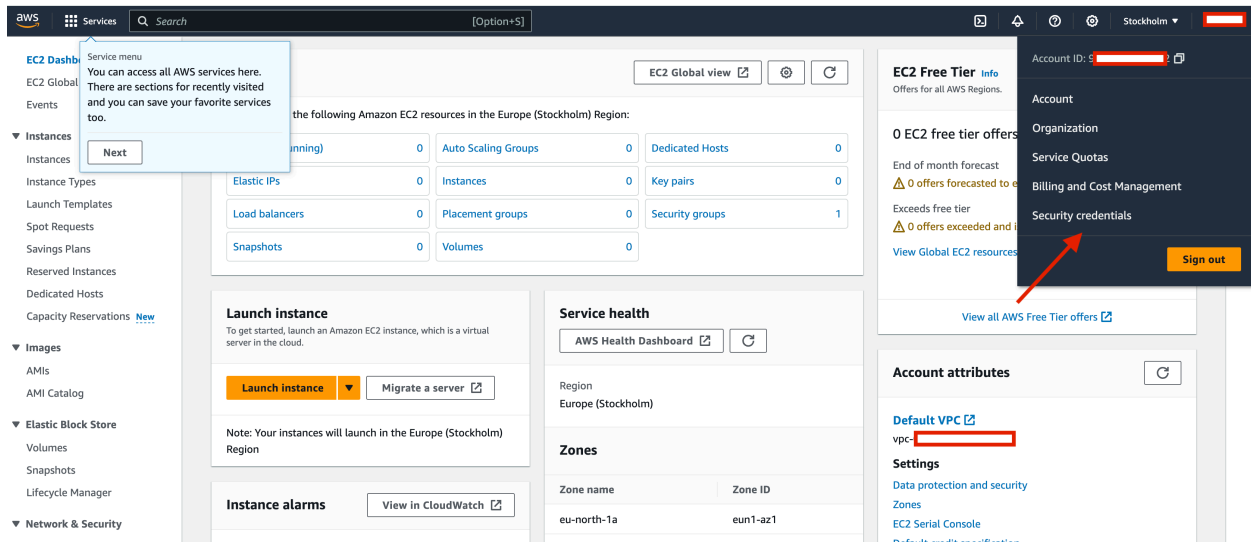

* Key ID

* API Key

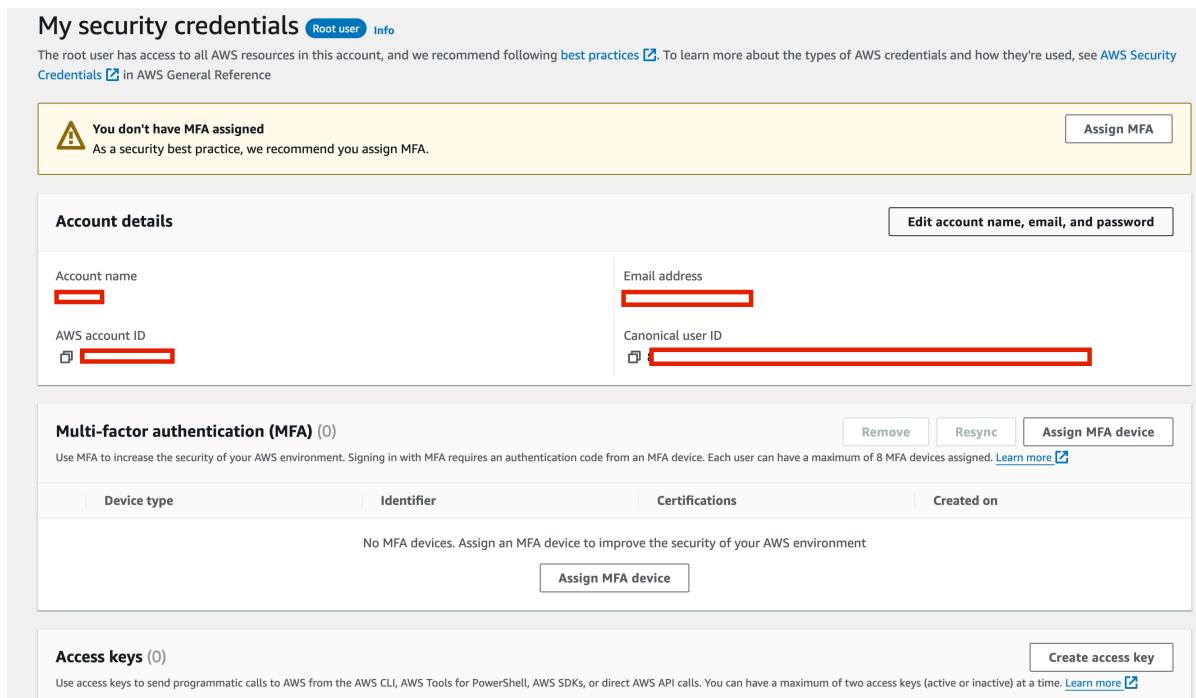

Create

Create & Close

You need to give your AWS account a name and as far as the Key ID and API are concerned, you will need to take those from within the AWS account itself. So login to your AWS account and click on Security Credentials.

You will be then taken to the following screen. On the bottom where you see “Access Key” click to create a new one.

Upon successful creation of the access key you should get 2 fields, one named “Access Key” and the second one named “Secret Access Key”. Now copy these fields and paste them into the Zeustrak textfields, into “Key Id” and “API Key” as you see below.

bcxfad

Please type the characters as shown above

Call Me Now

8. If the phone verification was successful, you'll be prompted to choose a plan. If you are unsure of what plan to choose, just try the **Free** one.

→ Next step

* Account Name

ex: account@email.com, John Doe Account 1...

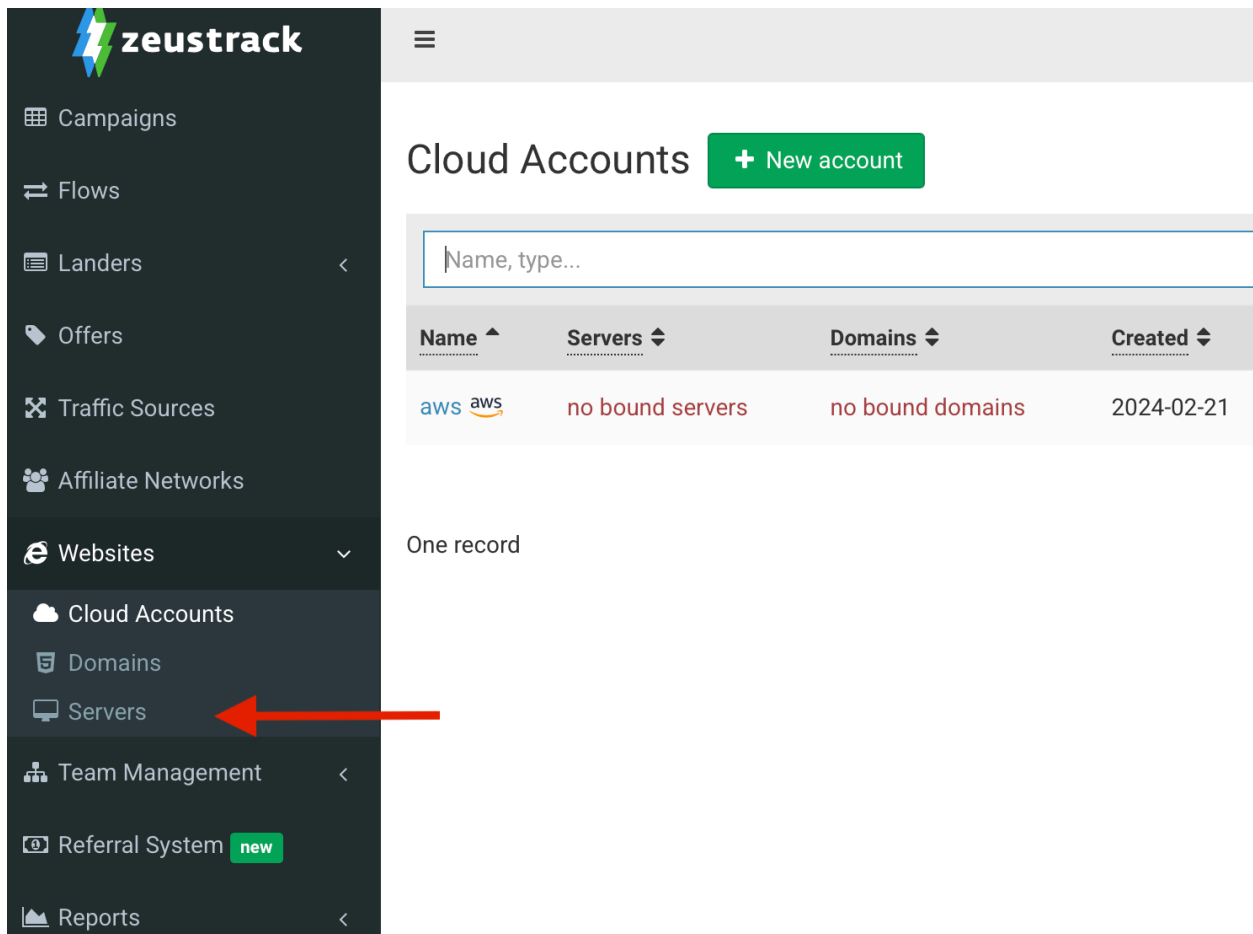

* Key ID

* API Key

CreateCreate & Close

After you give an account name (does not matter what) click “Create and Close” to successfully add access to the AWS account from your Zeustrak account.

Now on the left click Servers and then on to create a new server.

Servers

[+ New Server](#)

Create a new server into your Digital Ocean or AWS account. You will later use the server to attach a domain.

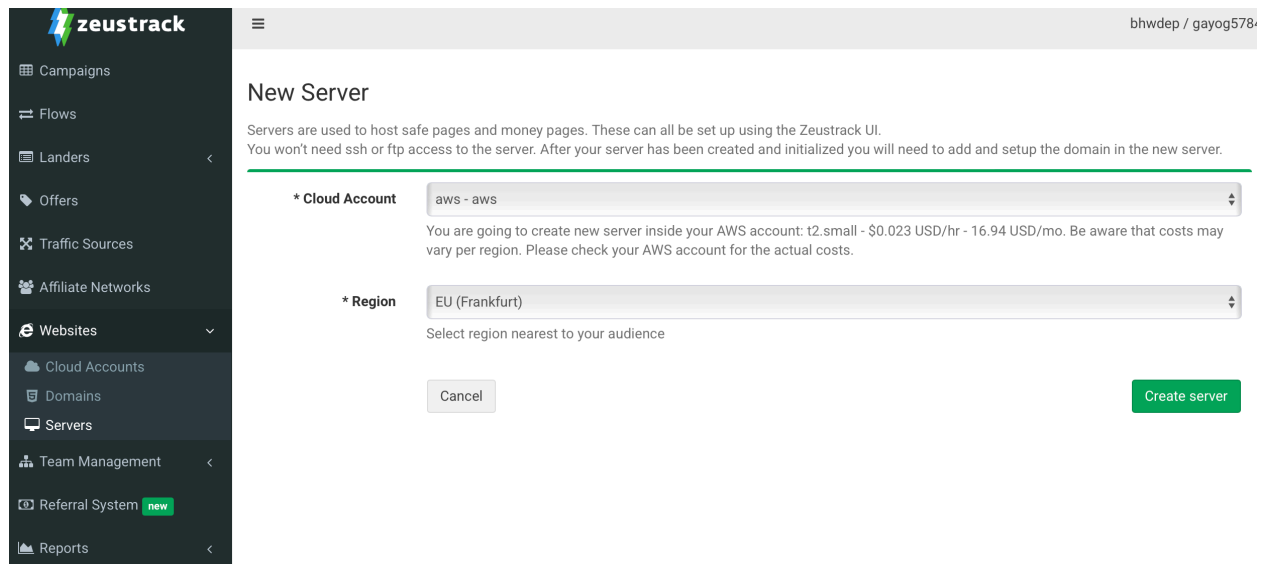

Note: click on the table row to add domain to server.

IP, region...

Status	IP Use this IP in domain's A entry	Region
Ok	51.44.12.222	eu-west-3

One record

Choose your cloud account and the region as you see below. What region you choose relates to what country or countries you expect your visitors to reside mostly in, if you advertise that

The screenshot shows the 'New Server' form in the Zeustrack dashboard. The left sidebar contains navigation links: Campaigns, Flows, Landers, Offers, Traffic Sources, Affiliate Networks, Websites, Cloud Accounts, Domains, Servers, Team Management, Referral System (marked 'new'), and Reports. The main content area has a header with the Zeustrack logo and a user profile 'bhwdep / gayog578'. Below the header, the 'New Server' section includes a note: 'Servers are used to host safe pages and money pages. These can all be set up using the Zeustrack UI. You won't need ssh or ftp access to the server. After your server has been created and initialized you will need to add and setup the domain in the new server.' The form has two main fields: '* Cloud Account' with a dropdown menu showing 'aws - aws' and a note 'You are going to create new server inside your AWS account: t2.small - \$0.023 USD/hr - 16.94 USD/mo. Be aware that costs may vary per region. Please check your AWS account for the actual costs.'; and '* Region' with a dropdown menu showing 'EU (Frankfurt)' and a note 'Select region nearest to your audience'. At the bottom of the form are 'Cancel' and 'Create server' buttons.

Zeustrack bhwdep / gayog578

New Server

Servers are used to host safe pages and money pages. These can all be set up using the Zeustrack UI. You won't need ssh or ftp access to the server. After your server has been created and initialized you will need to add and setup the domain in the new server.

* Cloud Account **aws - aws**

You are going to create new server inside your AWS account: t2.small - \$0.023 USD/hr - 16.94 USD/mo. Be aware that costs may vary per region. Please check your AWS account for the actual costs.

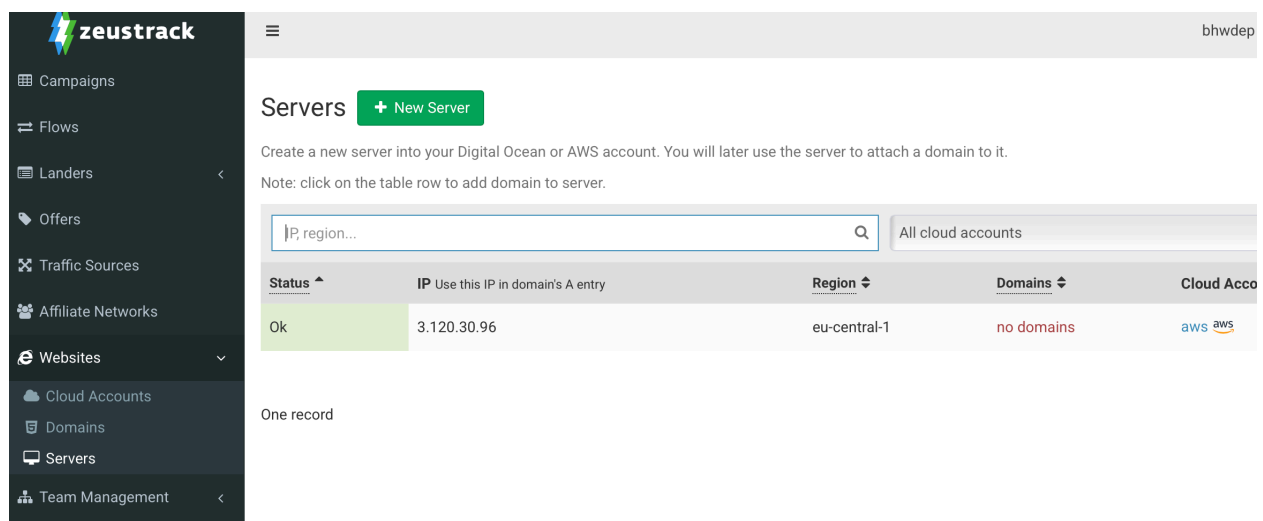

* Region **EU (Frankfurt)**

Select region nearest to your audience

Cancel Create server

would be the target country of your campaign. Choose an AWS region as close as possible to your targeting location for latency reasons so that your link destination loads faster. Click to create a new server.

Successful creation takes a minute or two and your server should then look green as below.

The screenshot shows the 'Servers' section in the Zeustrack dashboard. The left sidebar is the same as in the previous image. The main content area has a header with the Zeustrack logo and a user profile 'bhwdep'. Below the header, the 'Servers' section includes a '+ New Server' button and a note: 'Create a new server into your Digital Ocean or AWS account. You will later use the server to attach a domain to it. Note: click on the table row to add domain to server.' Below the note is a search bar with the placeholder 'IP, region...' and a search icon. To the right of the search bar is a button 'All cloud accounts'. Below the search bar is a table with the following columns: Status, IP Use this IP in domain's A entry, Region, Domains, and Cloud Acco. The table has one row with the following data: Status: Ok, IP: 3.120.30.96, Region: eu-central-1, Domains: no domains, Cloud Acco: aws. Below the table is a note 'One record'.

Zeustrack bhwdep

Servers + New Server

Create a new server into your Digital Ocean or AWS account. You will later use the server to attach a domain to it. Note: click on the table row to add domain to server.

IP, region... All cloud accounts

Status ^	IP Use this IP in domain's A entry	Region ^	Domains ^	Cloud Acco
Ok	3.120.30.96	eu-central-1	no domains	aws

One record

Click to paste this server IP address to your registrar. You need to create an A record for this domain that you will be using for cloaking and paste that new server IP you created on Zeus in the value field of the domain on your registrar. For instance, on Namecheap it looks like the following. The domain on the top of the image is the one we will be using for cloaking directly on the platform where we will be getting our visitors from and the A record is the IP of the server we just created on Zeustrak.

 atlantabook.site

Domain

Products

Sharing & Transfer

Advanced DNS

DNS TEMPLATES ? Choose DNS Template

HOST RECORDS ?

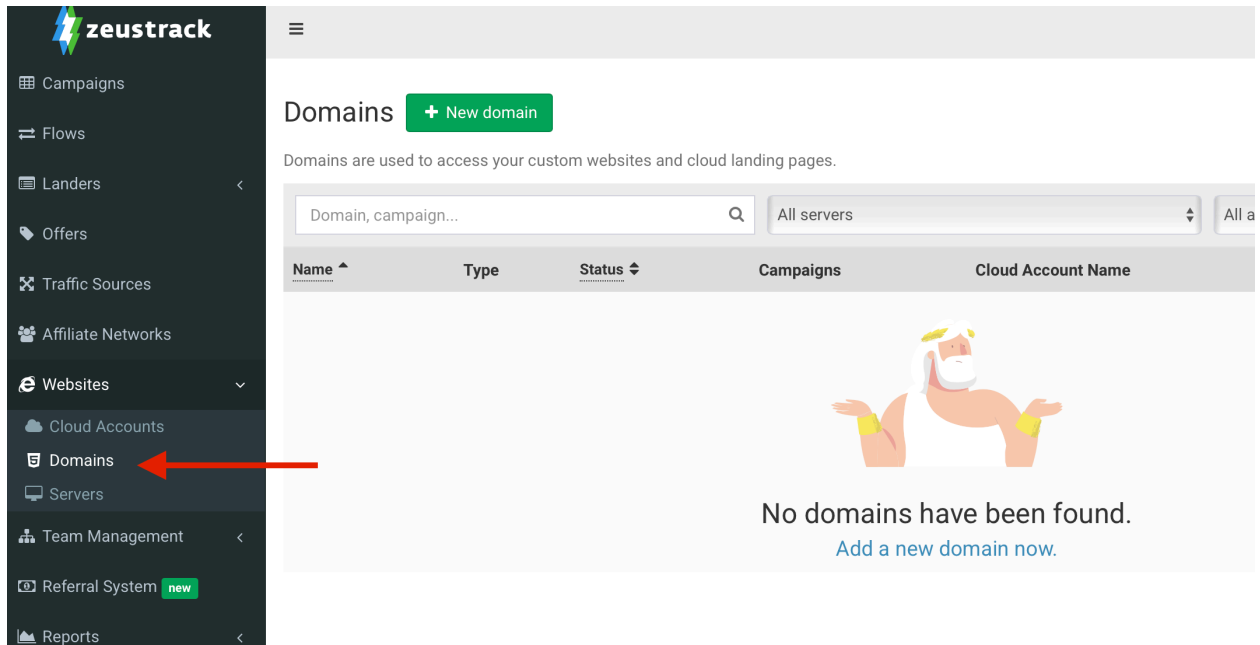

Actions Filters

Type	Host	Value	TTL
☐ A Record	@	3.120.30.96	Automatic

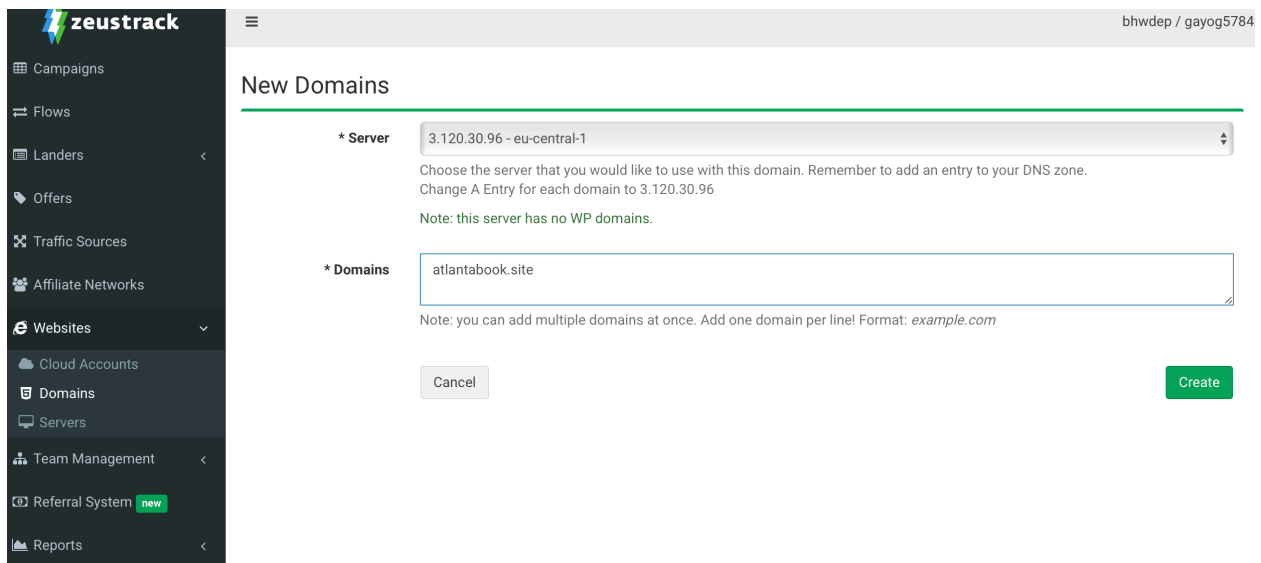

ADD NEW RECORD

It is a good idea to choose a new domain or a domain with good reputation for this as you do not want this domain to have been previously abused on the platforms you will be using it on.

After setting up the A record on the registrar and waiting for it to resolve properly (on Namecheap it takes a few minutes), grab this domain name, head back to Zeustrak and click on the Domains submenu as you see below.

Click to create a new domain selecting your already created server and the domain name you just set up on your registrar as shown here:

Click the “Create” button that takes you here:

Edit Domain: atlantabook.site Delete domain

* Server

3.120.30.96 - eu-central-1

Copy

Choose the server that you would like to use with this domain. Remember to add an entry to your DNS zone.

* Domain type

Tracking

Domain will support cloud landers, filtering and all other tracking options. Content will be shown on the main page of the domain.

Tracking + Clone existing site or webpage

Content of the website will be copied from existing domain. You will be able to use any of the pages of this domain for campaigns tracking and cloud hosting.

Tracking + Wordpress installation

A clean wordpress installation will be set up on this domain. You will be able to use any of the pages of this domain for campaigns tracking and cloud hosting.

Source website

http://example.com

In the Source website text field paste the domain you want to copy with the following format: *http://example.com* or *https://example.com*

Money pages

/about-us
/index.html
/
*

Select the middle option above. This is the area where you will be setting up your “safe page”. This is the page that will ultimately be shown to unwanted visitors and will be protecting your actual money page.

Here's what extremely cool about Zeustrak. You can select almost **any** site on the web, even major top ranking sites and Zeustrak will show those sites, instead of your money page, to unwanted visitors.

Source website	https://www.adventurouskate.com
In the Source website text field paste the domain you want to copy with the following format: <i>http://example.com</i> or <i>https://example.com</i>	
Money pages	/
Paste path of the pages you want to show to the user. Then you will be able to choose these pages in campaigns settings. For example, you have <i>yourdomain.com</i> and you want to use <i>yourdomain.com/about-us</i> as Money page, so you should enter <i>/about-us</i> . You can use several Money pages per domain. The filtering system decide if "user" is the user or bot/moderator. You will be able to setup filters at the Campaign level. Note: add one page per line!

Update

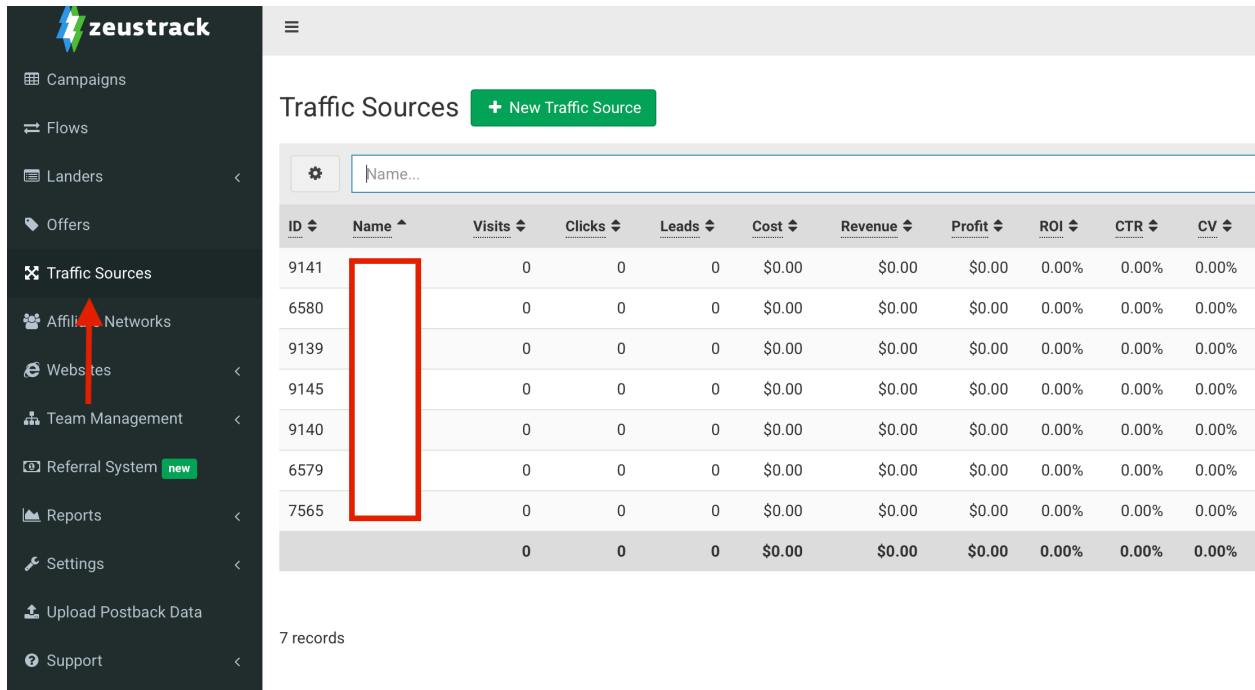

Update & Close

A random travel blog was selected above. Click to update and close that page now.

Our cloaking setup is now ready. Now we need to create a campaign that we will be using on traffic sources or, for that matter, wherever you get visitors from.

Before we proceed with the campaign creation, click quickly on Traffic Sources on the left to set up your traffic source on Zeus. You not only need this to set up your campaign but also for

tracking purposes later on if you want to see what visitors you get from what traffic source for example so as to make decisions on optimization.

Campaigns + New Campaign

Name, tag, username...

Filters	ID	Name	Overall	Bleed	Visits	Clicks	Leads	Cost	Revenue	Profit	ROI	CTR	CV	CR	CPV	CPL
---------	----	------	---------	-------	--------	--------	-------	------	---------	--------	-----	-----	----	----	-----	-----

No campaigns have been found.
Try to change the time period. [You can create a new campaign.](#)

In the first tab, “General”, in order to populate your campaign money page url that you see below, you need to fill in all relevant information. Give your campaign a descriptive name so you know what it does when you see it on the overview dashboard later on. Next select the country or countries your visitors will be coming from. This is important as you will see on the filtering tab next. Then, select the traffic source you created on the previous step and finally set the tracking domain whose A record you set up just before on your registrar.

The screenshot shows the 'New Campaign' form with the 'General' tab selected. The form includes the following fields and options:

- Money page URL:** `https://atlantabook.site/?utm_campaign=SzAZ3nAJlw&subid={subid}&subid2={subid2}&subid3={subid3}`
- Full name:** BHW - GB - BHWtest
- * Name:** BHWtest
- Countries:** United Kingdom of Great Britain and Northern Ireland [GB] (with a dropdown arrow and a note: 'Leave it blank to accept any country')
- * Traffic source:** BHW (dropdown menu)
- * Tracking domain:** atlantabook.site (dropdown menu) with a green 'Verify' button next to it.
- Money pages:** A text area containing a single forward slash (/). Below it is a note: 'Add only one URL per line'.
- * Category:** General (dropdown menu with a help icon)

The left sidebar contains the following menu items: Campaigns, Flows, Landers, Offers, Traffic Sources, Affiliate Networks, Websites, Team Management, Referral System (marked 'new'), Reports, Settings, Upload Postback Data, and Support.

Now on to the second tab, “Destination”.

Create

Create & Close

Select the URL and 302 options and enter your **money site url**. This is the page/site that you actually want to show to your visitors so make sure it is entered correctly because traffic will get redirected here.

The meta refresh options are more advanced and are sometimes used if people want to hide their actual money page from affiliate networks or spy tools since those entities seem to rip off money sites and reproduce them. The tradeoff if you use those is on the redirection time as it takes more time for your page to load to visitors and especially since most of your traffic will be on mobile, this is not something you want. That is why we select 302 for now. The Flow and Path options are also more sophisticated and you want to use those when setting up a more complicated funnel with different pages, conditions and rules. For instance, if visitor on Chrome then visit X page, if from a Samsung phone then visit Y page, if from Canada then visit Z page and so forth. For our purpose on this guide here, we do not need any of that.

Click on the third tab, “Filters”. This is the **most important tab** and I have selected for you below the filters that work best after a lot of testing. These filters will protect your money page from unwanted visits at all times and enable you to run your campaigns for longevity. Also, pay attention on selecting to allow only campaign specific countries below which allows traffic from only the countries you selected when setting up the first tab of your campaign, in other words, anyone visiting from outside those countries will be shown your “safe page” and not get redirected to the money page. This is just an extra measure of protection for your money page.

BHW - GB - BHWtest

00.00%0000\$0.00\$0.00\$0.000.00%0.00%0.00%

00.00%0000\$0.00\$0.00\$0.000.00%0.00%0.00%

Active means your campaign is live and working as it should, aka blocking unwanted visits as set by the filters and showing your money page to legitimate visitors. **Allow All** means that nothing is filtered and everyone sees your money page, you can use this option for testing purposes to see if you can properly access your money page through your campaign url at all times. **Filter All** means that everything is filtered, noone sees your money page because everyone sees your safe page and not getting redirected anywhere else. You use this sometimes when you first introduce a campaign money url to a platform because if that platform have never crawled the domain before, they are going to check it out and you want to make sure all traffic stays on the safe page and not get redirected because if it did, it might mean ad disapproval or account terminanation. After that initial review though, you can switch the color from red to green so your campaign is ready to start accepting legitimate visitors.

Now left click anywhere on the campaign line and you will see this:

Filters	ID	Name ^	Overall	Bleed	Visits	Clicks	Leads	Cost	Revenue	Profit	ROI	CTR	CV	CR

Money pages

/

Grab your money page URL (once again this is the url that you are going to be using on the platforms you get traffic from and this is the one that performs the cloaking/filtering of unwanted visitors). As you see beyond the first ‘&’ character on that url there are 3 subid parameters and those are used for tracking purposes (you can edit those directly at the traffic source menu). For now we are going to skip those and this is not going to affect our URL functionality at all. That means that for the purposes of testing we are going to select the URL as follows:

General

Destination

Filters

User Access

Money page URL

https://atlantabook.site/?utm_campaign=SzAZ3nAJlw&subid={subid}&subid2={subid2}&subid3={subid3}

Copy

I have now loaded the underlined above URL on the browser on two different locations to record two different visits for our campaign.

Let’s get back to the “Visits” tab inside the campaign to see what has been tracked.
